

## Effect of the COVID-19 Pandemic on Traffic in New York State in 2020

**Highway Data Services Bureau**  
[MO-TrafficDataViewer@dot.ny.gov](mailto:MO-TrafficDataViewer@dot.ny.gov)

*last updated February 2021*

## **Introduction**

The emergence of COVID-19 in the United States in early Spring 2020 has significantly altered the lives and behavior of all Americans. The impact COVID-19 had on New Yorkers' lives can be seen through observing changes in traffic volumes and patterns throughout 2020. To visualize the effects on travel and commuting behavior across the state, the Highway Data Services Bureau (HDSB) formed comparable groups of data that could reflect the average daily traffic distribution on any given area/roadway across the state. To get a relative understanding of how and where COVID-19 affected New York State traffic, each average daily traffic distribution was compared to the group's respective average from 2017-2019. This approach allowed for a direct comparison of 2020 traffic volume and distribution to the previous three-year average.

## **Groupings**

### **Temporal – Monthly**

Given the limited number of time periods to analyze, it was determined that Average Daily Distribution would be grouped by Month. To discover the possible effects of COVID-19 on traffic patterns, grouping by Month helped to illustrate distinct differences over the year and provided enough data to alleviate small sample sizes.

### **Spatial – Region**

Initial attempts were made to find common patterns and relationships among the Regions in order to minimize the number of groups needed to express the effects of COVID-19 on traffic volumes and patterns. All 11 regions varied from each other enough to warrant separating each one into its own group. Due to the limited number of continuous count sites (CCS), grouping by Region was the most representative spatial characteristic possible. Due to the absence of CCS across each Region, many values were filled in with the Statewide values.

### **Qualitative – Functional Class**

A number of Functional Class groupings were attempted, with four groupings ultimately determined to be the best fit. Expressways were grouped by Rural and Urban locations, thereby creating two groups. Other roadways were grouped by Rural and Urban locations creating another two groups. Grouping all non-expressways was necessary due to a lack of samples on lower functional classes such as minor collectors and local roads.

This method of grouping allowed for a reasonably low number of required observations while maintaining a specific set of characteristics that could be applied representatively throughout the state.

## **Average Daily Distributions**

Group average daily distributions all follow the same procedure and are based on the Average Weekday Hourly counts for the total roadway. The procedure is described below.

- 1) For each count, the Hourly values were divided by the daily total. This process provided 24 hourly percentages.
- 2) Counts for each group were then averaged to provide an average distribution. This average distribution was not weighted by AADT or any other factor.

The Typical Values were created using all available short and continuous counts from the years 2017-2019. The 2020 values were created using all short and continuous counts available as of 02/15/2020. These current 2020 values may be updated as more data is processed.

## **Adjusted 2020 values**

2020 group averages were adjusted by the typical reduction for the month. Typical Reduction was calculated using continuous count data from 2017-2019 and 2020 as follows.

- 1) An Average MADT for Weekday traffic was calculated by averaging all values for 2017-2019 by site.
- 2) The percent difference was calculated for each site using the 2017-2019 average as a baseline.
- 3) The percent difference was averaged by group to produce an average percent difference.
- 4) This average percent difference was then applied to each hourly percentage for the group.

The resulting values demonstrate the 2020 daily distributions as a percentage of the typical AADT rather than the 2020 AADT. This enables charts displaying typical distributions and 2020 distribution to distinguish the differences in traffic volumes over 2020.

## **AADT vs VMT**

Currently, percent reduction by Region and Month is based on the average AADT difference by group. Each site's difference is calculated, and then the group is averaged. There is no weighting for higher AADT or VMT roadways.

With the assumption that AADTs are down similarly in each group, the percent reduction can be similarly applied to VMT. Once 2020 is closed out, VMT will be calculated in a more traditional manner. At that time the current assumption will either be validated or replaced with more correct reductions for VMT values.

## **Data Availability**

Values used to produce the charts contained within this document are available as an MS Excel file upon request to the Traffic Data Viewer ([MO-TrafficDataViewer@dot.ny.gov](mailto:MO-TrafficDataViewer@dot.ny.gov)). The raw data used will be posted to [https://www.dot.ny.gov/divisions/engineering/technical-services/highway-data-services/hdsb during 2021](https://www.dot.ny.gov/divisions/engineering/technical-services/highway-data-services/hdsb%20during%202021).

Click on the value in the Index Chart on the next page to see the hourly graph of each group.

# Average Percentage Difference Between 2020 Weekday MADT and Average Weekday MADT
